

Several ideas to come to mind.

1. Every time a teen or college student or an adult gets in their car behind the wheel. The cellphone towers or phone companies can switch a switch signal in the area where the person is getting behind the wheel of the car can be turn "OFF" on the cellphone "text section" of the phone will be turn OFF. If that person is texting someone while driving, the signal can shut off the texting signal Off automatically from the cellphone towers. While using a motion vehicle and texting, The signal from the towers can pick up the signals from any cellphone who is driving and SHUT OFF all use of the phone. Except the emergency call only while driving. You call home, office, a friend etc, (But you`ll be unable to text anyone) but you have use hands free device to talk. When getting out the motion vehicle the signals from the towers can turn ON the phones automatically as you can text someone anywhere. It just turn off while driving.

2. Drinking or getting drunk and want to drive your car home. The auto makers can put a device in any car (like a breather test from the Police Department) install the device inside any car near the ignition or around the dashboard and you have to breather or blow into this device. If the breath test FAILS or go over the limit, your car will NOT Start.

3. Or let your car think for you. Since we have the technology on almost everything we do around us. Why don`t we have some kind air device inside the cars that tells you if you had too much to drink and your car set off some kind alarm(quite alarm) sound to local police Department or taxi service to tell. This person tries to start their car while drunk and needs someone to call home or a taxi to pick this person up and take him/she home safely.
